

## EU intervention logic and results framework guidance (seed summary)

### Purpose

This seed summary supports retrieval for EU-style intervention logic drafting (overall objective, specific objectives, outputs, indicators, assumptions). Replace with official EU/EuropeAid guidance in production.

### Typical intervention logic structure

- Overall objective (long-term change and rationale)
- Specific objectives / outcomes (changes directly attributable within program scope)
- Outputs (deliverables produced by the action)
- Activities (what the action implements)
- Assumptions and external factors

### Drafting expectations for EU-style proposals

- The overall objective should include a rationale and clear policy relevance.
- Specific objectives should be concrete and measurable.
- Outputs should be linked to implementation packages and beneficiaries.
- Indicators should include baseline, target, and means of verification.
- Assumptions and risks should be explicitly documented.

### Governance and digital service delivery focus

- User-centric service quality improvements
- Institutional capacity for implementation and monitoring
- Inter-agency coordination and process standardization
- Data governance and digital inclusion considerations

### Common weaknesses to avoid

- Vague overall objective with no rationale
- Outputs not linked to specific objectives
- Indicators without baselines or verification sources
- Missing implementation responsibilities
