

Q3 Widget Launch - embedded widget blocked by CSP on SharePoint pages

Q3 Widget Launch integration issue from a pilot customer.

Embedding a Q3 widget in a SharePoint page fails. The browser blocks the iframe with a Content-Security-Policy frame-ancestors violation, and the widget area renders blank. The same widget loads fine in the standalone app.

No existing task on the launch covers this. Filed via this email so the morning sweep picks it up. Attached PDF has the failing page URL, the console error, and the CSP header that needs the allowance.
